Art Unit

1764

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --  
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

### Status

- 1) ☒ Responsive to communication(s) filed on 17 August 2005.  
2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.  
3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

### Disposition of Claims

- 4) ☒ Claim(s) 1-6 and 9-16 is/are pending in the application.  
4a) Of the above claim(s) 9-15 is/are withdrawn from consideration.  
5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.  
6) ☒ Claim(s) 1-6 and 16 is/are rejected.  
7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.  
8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

### Application Papers

- 9) ☐ The specification is objected to by the Examiner.  
10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).  
11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

### Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).  
a) ☐ All b) ☐ Some \* c) ☐ None of:  
1. ☐ Certified copies of the priority documents have been received.  
2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.  
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

### Attachment(s)

- 1) ☐ Notice of References Cited (PTO-892)  
2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)  
3) ☐ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)  
Paper No(s)/Mail Date \_\_\_\_\_  
4) ☐ Interview Summary (PTO-413)  
Paper No(s)/Mail Date. \_\_\_\_\_  
5) ☐ Notice of Informal Patent Application (PTO-152)  
6) ☐ Other: \_\_\_\_\_

## **DETAILED ACTION**

### ***Claim Rejections - 35 USC § 102***

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claim 16 is rejected under 35 U.S.C. 102(b) as being anticipated by McCollum et al. (3,948,755).

McCollum discloses a process for upgrading a heavy oil by contacting the heavy oil with water at a high temperature and pressure in the presence of a catalyst comprising a metal oxide to reduce metals (e.g., vanadium) and sulfur compounds in the heavy oil. McCollum also discloses that the water also contains a reaction accelerator (e.g., methyl alcohol). The process is operated at a temperature of from 600-900° F and at a pressure of about 4000 psi (27 MPa). It is noted that McCollum does not specifically disclose that the vanadium is scavenged in the form of vanadium oxide and or metallic compound and does not disclose that sulfur is scavenged in the form of a sulfate and/or a metal sulfide. However, the heavy oil is contacted with water at a high temperature and pressure as claimed. It would be expected that at least one vanadium and at least one sulfur compound produced in the process of McCollum would be in the claimed form. (See col. 3, line 56 through col. 4, line 18; col. 7, line 67 through col. 8, line 50; col. 9, line 65 through col. 10, lines 6; table 9)

### ***Claim Rejections - 35 USC § 103***

Art Unit: 1764

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 1-6 are rejected under 35 U.S.C. 103(a) as being unpatentable over McCollum et al. (3,948,755).

McCollum discloses a process for upgrading a heavy oil by contacting the heavy oil with water at a high temperature and pressure in the presence of a catalyst comprising a metal oxide to reduce metals (e.g., vanadium) and sulfur compounds in the heavy oil. McCollum also discloses

Art Unit: 1764

that the water also contains a reaction accelerator (e.g., methyl alcohol). The process is operated at a temperature of from 600-900° F and at a pressure of about 4000 psi (27 MPa). It is noted that McCollum does not specifically disclose that the vanadium is scavenged in the form of vanadium oxide and or metallic compound and does not disclose that sulfur is scavenged in the form of a sulfate and/or a metal sulfide. However, the heavy oil is contacted with water at a high temperature and pressure as claimed. It would be expected that at least one vanadium and at least one sulfur compound produced in the process of McCollum would be in the claimed form. (See col. 3, line 56 through col. 4, line 18; col. 7, line 67 through col. 8, line 50; col. 9, line 65 through col. 10, lines 6; table 9)

McCollum does not disclose that water is heated to 300 to 500 and pressuring to 10 MPa to 30 MPa before contacting with the heavy oil.

It would have been obvious to one having ordinary skill in the art at the time the invention was made to have modified the process of McCollum by heating and pressuring the water as claimed because McCollum teaches that the process is operated at a temperature of from 600-900° F and at a pressure about 4000 psi (27 MPa). Therefore, it is affective to heat and pressure the water to the operating condition before passing the water into the reaction zone.

McCollum does not specifically disclose that water is either supercritical water or subcritical water. However, it would have been obvious to one having ordinary skill in the art at the time the invention was made to have modified the process of McCollum by operating the process of McCollum at either supercritical water or subcritical water because McCollum suggests water used in the process is at high pressures and at a temperature of from 600 to 900°

Art Unit: 1764

F. Therefore, one of skill in the art would operate the process of McCollum at any condition including at either supercritical water or subcritical water.

Claims 1 and 3-6 and 16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wilson et al. (3,733,259)

Wilson discloses a process for removing sulfur and metals (e.g., vanadium) from a heavy oil feed. The feed is contacted with water at a high temperature and pressure and the mixture of the heavy oil and water is then contacted with a scavenger (e.g., catalyst comprising alumina) to produce a product having a low amount of sulfur and vanadium. (See col. 1, lines 11-26; col. 2, lines 22-62; col. 3, line 1; Example II and III, tables I, II and III)

Wilson does not specifically disclose that the vanadium is scavenged in the form of vanadium oxide and or metallic compound and does not disclose that sulfur is scavenged in the form of a sulfate and/or a metal sulfide. However, the heavy oil is contacted with water at a high temperature and pressure as claimed. It would be expected that the at least one vanadium and at least one sulfur compound produced in the process of Wilson would be in the claimed form.

Wilson does not specifically disclose that water is in either supercritical or subcritical. However, it would have been obvious to one having ordinary skill in the art at the time the invention was made to have modified the process of Wilson by operating the process of Wilson at either supercritical water or subcritical water because Wilson teaches that the process is operated at temperature of from 750 to 850° F and at a pressure of from atmospheric up to 100 atm. Therefore, one of skill in the art would operate the process of Wilson at any condition including at either supercritical water or subcritical water.

Art Unit: 1764

Wilson does not disclose that water is heated to 300 to 500 and pressuring to 10 MPa to 30 MPa before contacting with the heavy oil.

It would have been obvious to one having ordinary skill in the art at the time the invention was made to have modified the process of Wilson by heating and pressuring the water as claimed because Wilson teaches that the process is operated at a temperature of from 399-454° C F and at a pressure about 2-20 MPa. Therefore, it is affective to heat and pressure the water to the operating condition before passing the water into reaction zone.

### ***Response to Arguments***

The argument that McCollum does not discloses that the water has been pressure to 10 to 30 MPa is not persuasive because McCollum teaches that the process is operated at a pressure about 4000 pounds per square inch gauge (psig). It would be effective to recondition the water to the reaction conditions. See col. 19, lines 36-38; col. 20, line 41; Table 10; also see the new rejection above.

The argument that Wilson does not teaches that the water has been pressure to 10 to 30 MPa is not persuasive because Willson teaches that the process is operated at a pressure of from 2 – 20 MPa. It would be effective to recondition the water to the reaction conditions.

The argument that the present invention does not require an additional catalyst while Wilson is required because the claimed process does not exclude the use of a catalyst.

Art Unit: 1764

***Conclusion***

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Tam M. Nguyen whose telephone number is (571) 272-1452. The examiner can normally be reached on Monday through Thursday.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Glenn Caldarola can be reached on (571) 272-1444. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
